

COLLECTING TABLE

For the arrangement of bottles into trays

DESCRIPTION

The pallet collecting table is a semi-automatic device for positioning thermoplastic bottles so that they can easily be arranged in parallel rows and then packed in boxes or pallets.

The machine operator simply inserts the empty box, closed on three sides, under the collecting table.

When the rows previously set on the operator panel are full, the pneumatic pusher does another run to expel part of the box positioned previously and create the space necessary for the new bottles so the operator can close the full box and position a new one.

This type of collecting table can also be used to cool the bottles before dropping them into the boxes, which can be positioned at the end of the table, on the ground, or on a conveyor belt, with piece counting and box changing.

MAIN TECHNICAL FEATURES

Overall Dimension for standard collecting table: 1350 x 2250 x 1350
